

How To Create A Safe, Persistent Ubuntu Linux USB Stick, Using Your Windows Computer

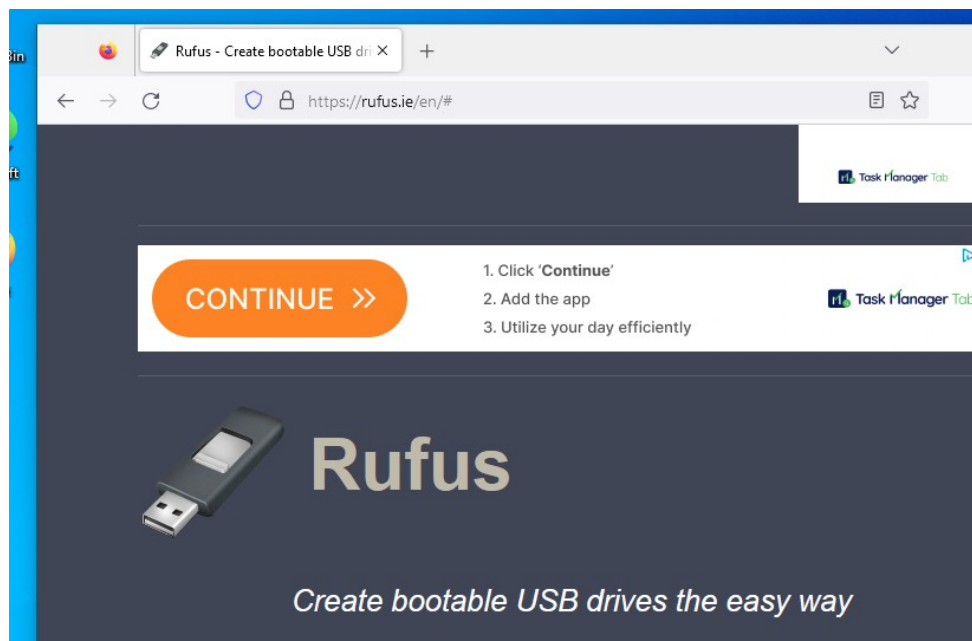

This means that instead of your computer running Windows, it will temporarily run Ubuntu Linux. And it will run it from the USB stick. This is a safer, more secure way when you want to do anything related to finances, wealth, etc.

By running Linux, and not running anything from a corporation (aka Windows), you are more in control of what's going on behind the scenes. Meaning there's no hidden application that is secretly recording your private information as you use the computer.

Once your computer is on and in Windows, open a browser and search for “install rufus”.

This below is what the website looks like:

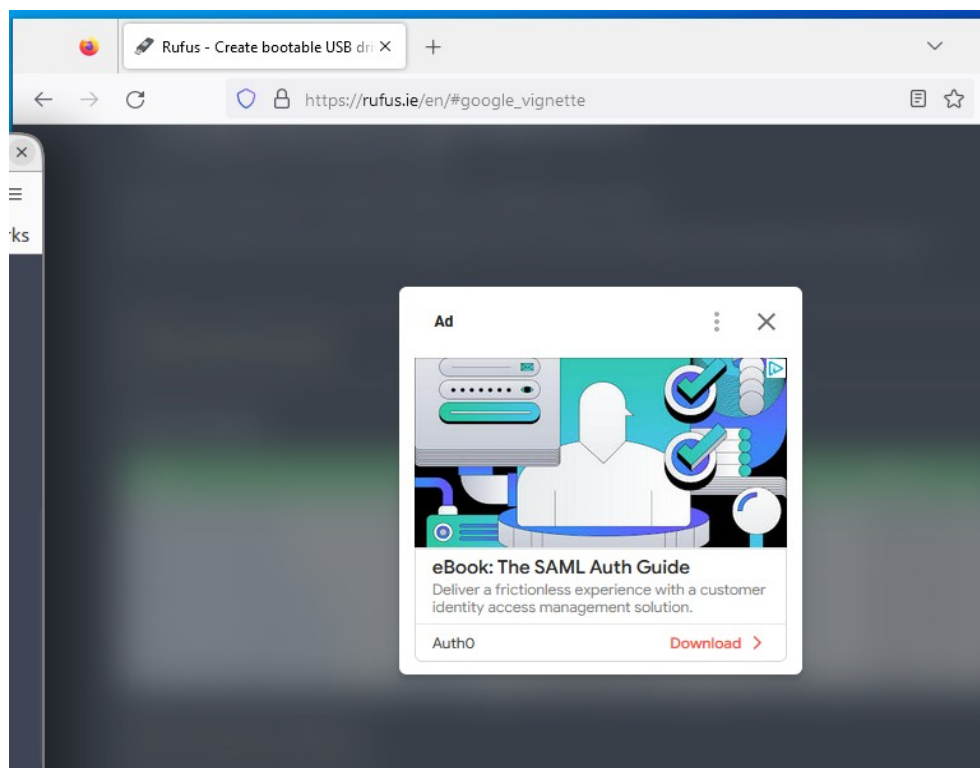

Find the “Downloads” link or tab until you see the “Latest releases” selection list.

You want to download the “Portable” selection.

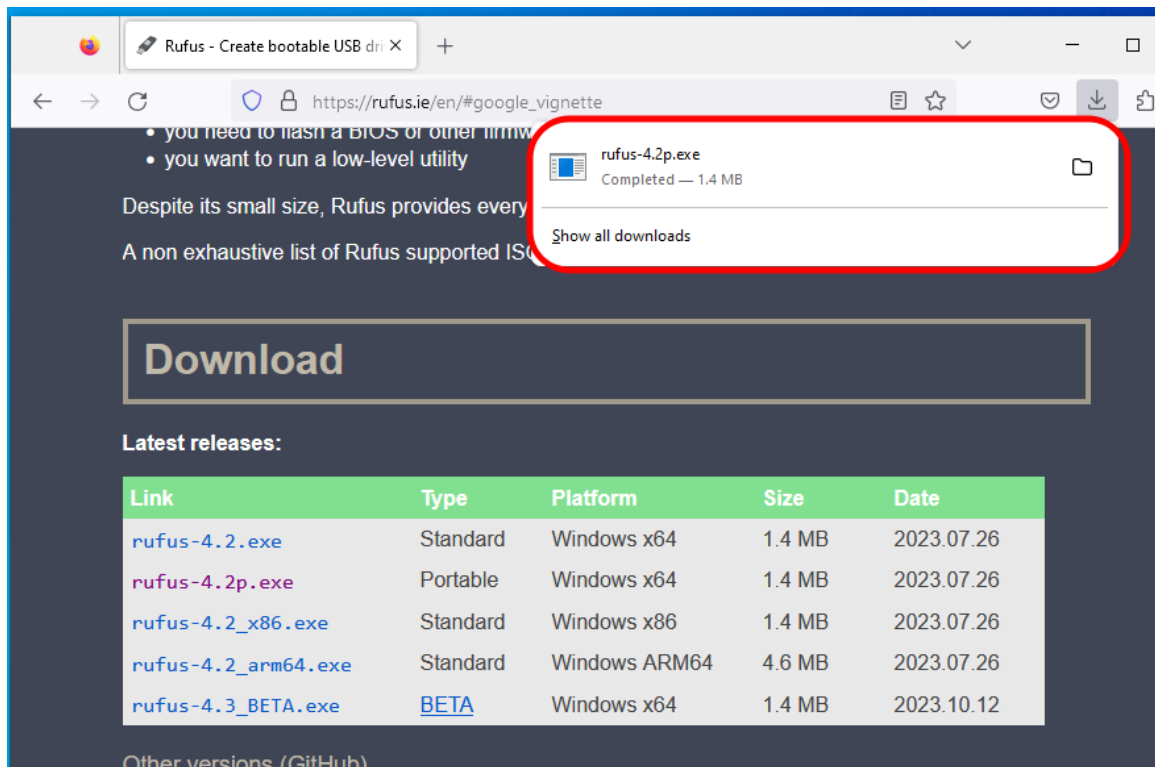

Get the latest version (which may be higher than shown here)

Download				
Latest releases:				
Link	Type	Platform	Size	Date
rufus-4.2.exe	Standard	Windows x64	1.4 MB	2023.07.26
rufus-4.2p.exe	Portable	Windows x64	1.4 MB	2023.07.26
rufus-4.2_x86.exe	Standard	Windows x86	1.4 MB	2023.07.26
rufus-4.2_arm64.exe	Standard	Windows ARM64	4.6 MB	2023.07.26
rufus-4.3_BETA.exe	BETA	Windows x64	1.4 MB	2023.10.12
Other versions (GitHub)				

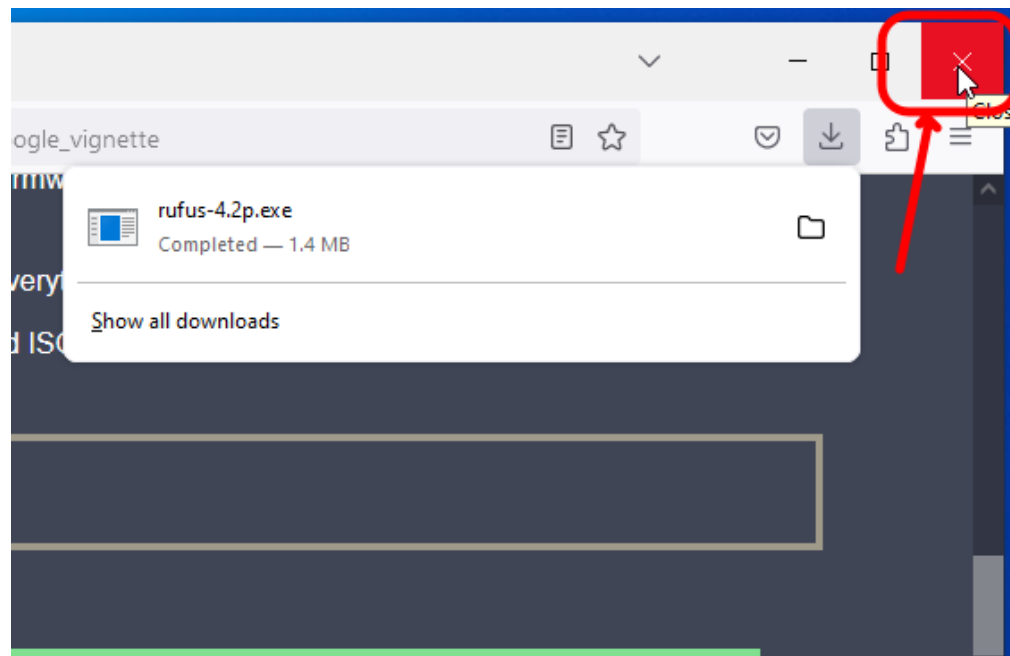

While it is downloading you might see (below), just click in the grayed out area, DON'T click on anything in the center box - it's an advertisement.

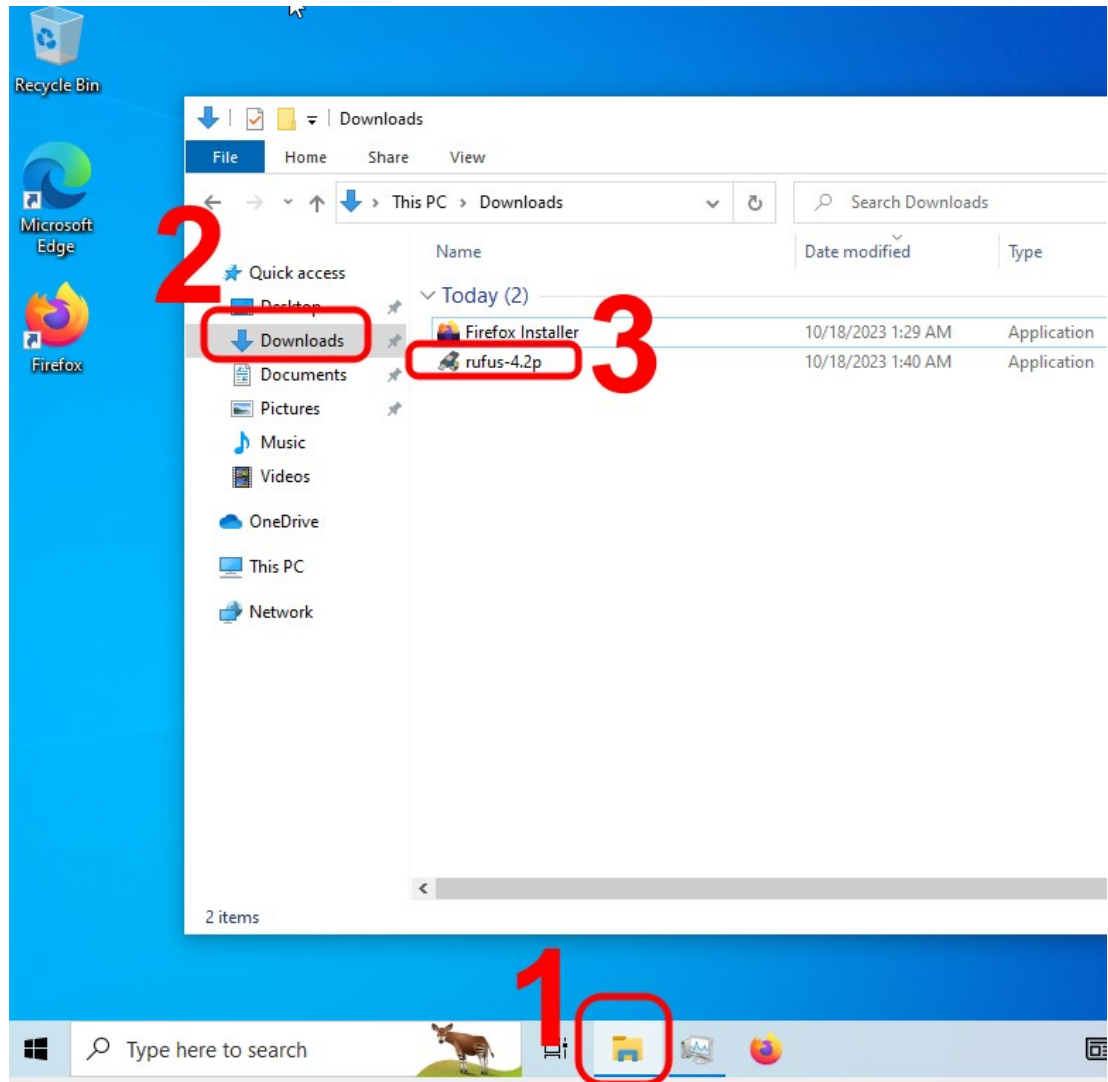

Once it is downloaded, you may see (below):

When download completes, close browser. We don't need it anymore until we download the Ubuntu ISO.

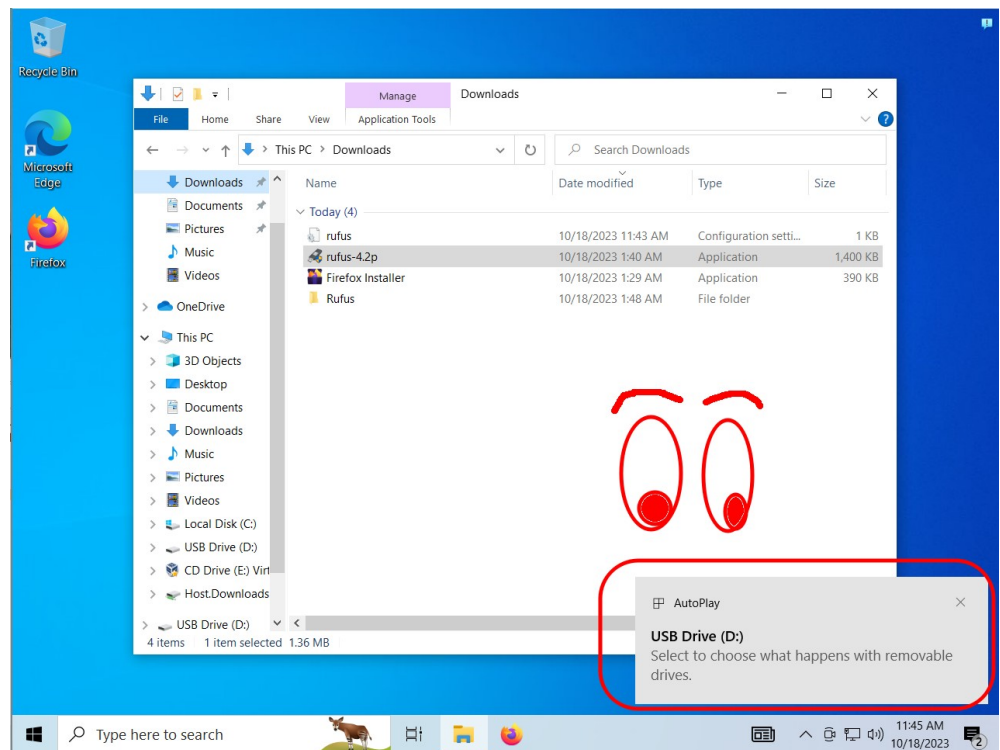

Open your File Explorer, and click “Downloads” in the left-side navigation area.

“Rufus” is the tool we will use to create the USB Ubuntu stick.

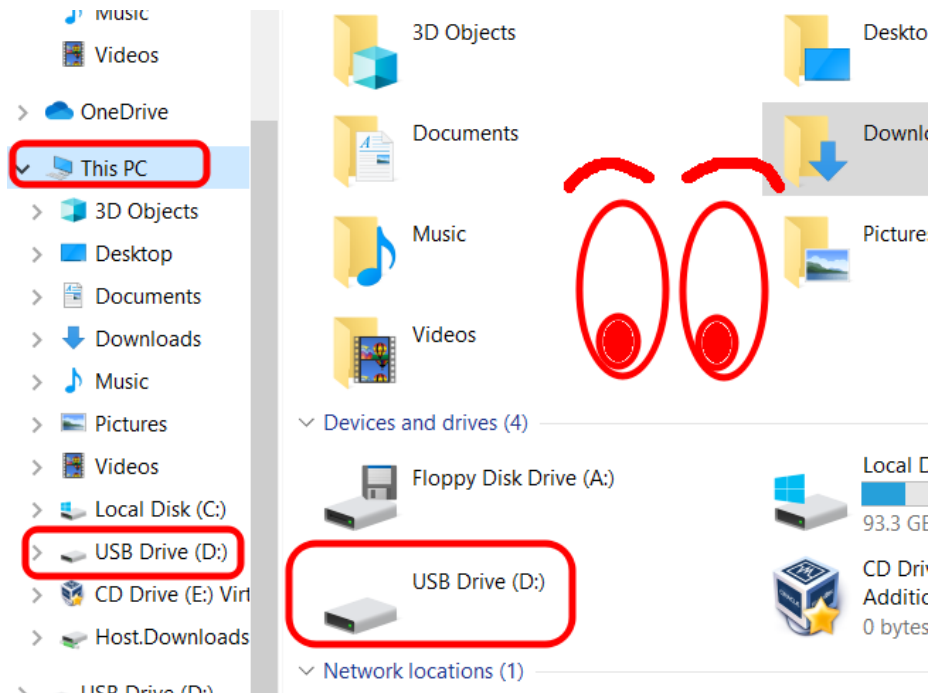

Back to this in a moment but first, the USB stick.

Next, insert the USB stick and see that Windows “sees” it.

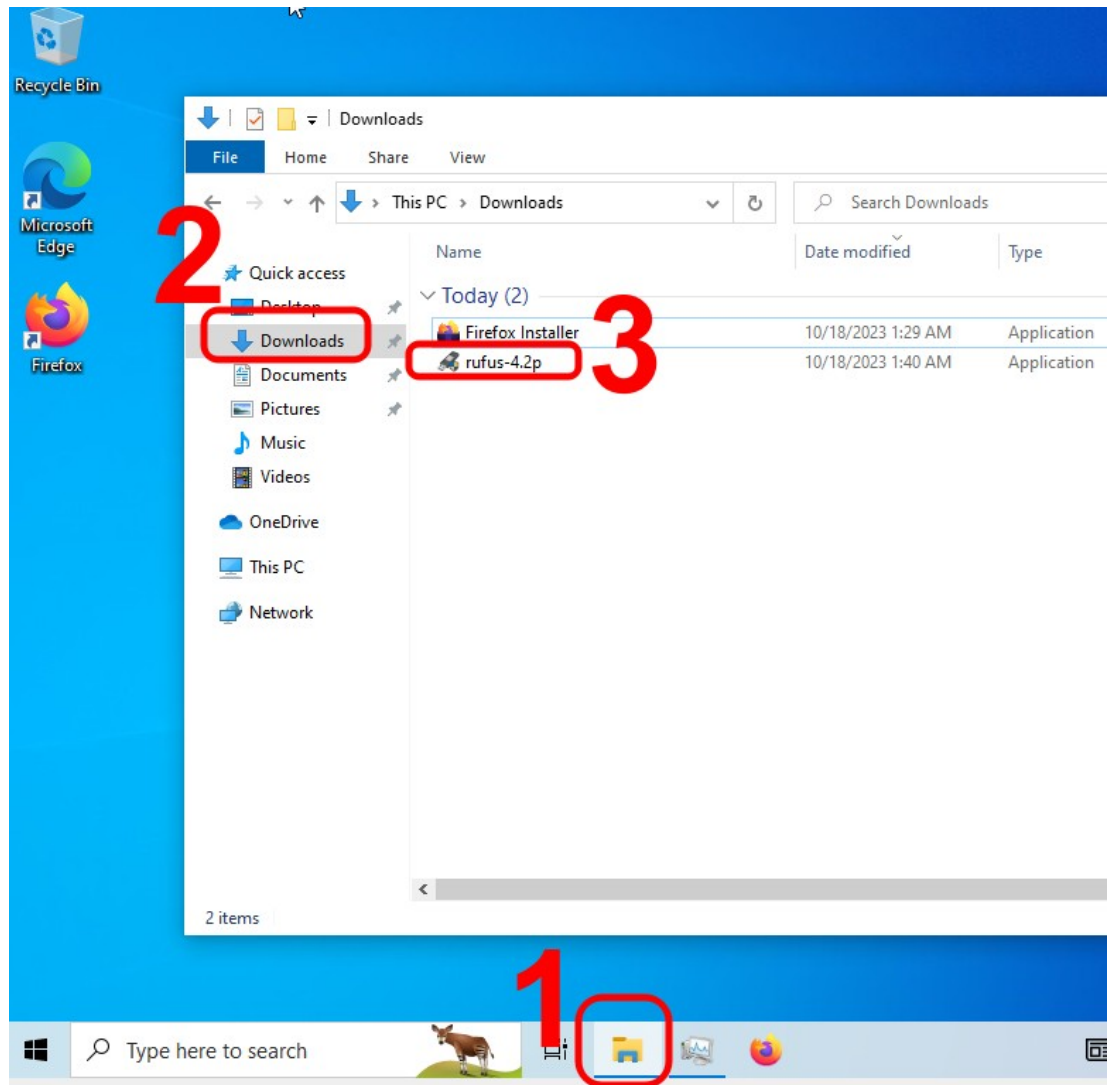

Now, click “My Computer” or “This PC” until File Explorer shows all the drives. Hopefully you see that it shows the USB stick.

If it does NOT, there’s a problem. Maybe try another USB stick.

If you DO see it, leave it inserted.

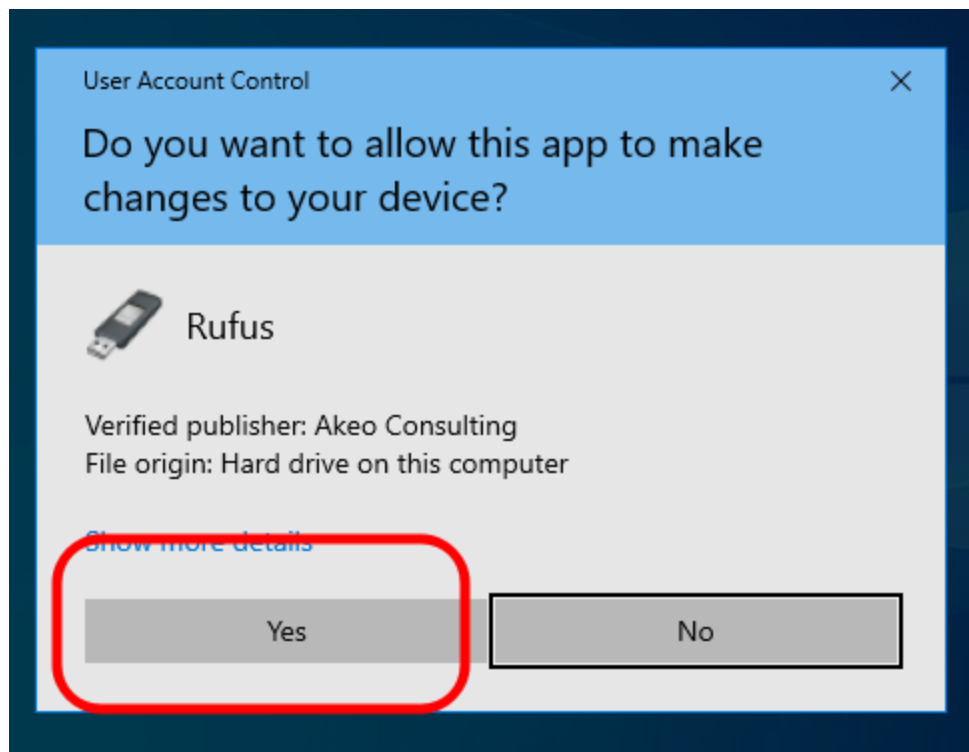

Ok, we can go back to the “Downloads” area of File Explorer.

Right-click on rufus-4.2p, run as Administrator

Click "Yes"

Since we just downloaded the very latest release of Rufus, you can answer “No” here.

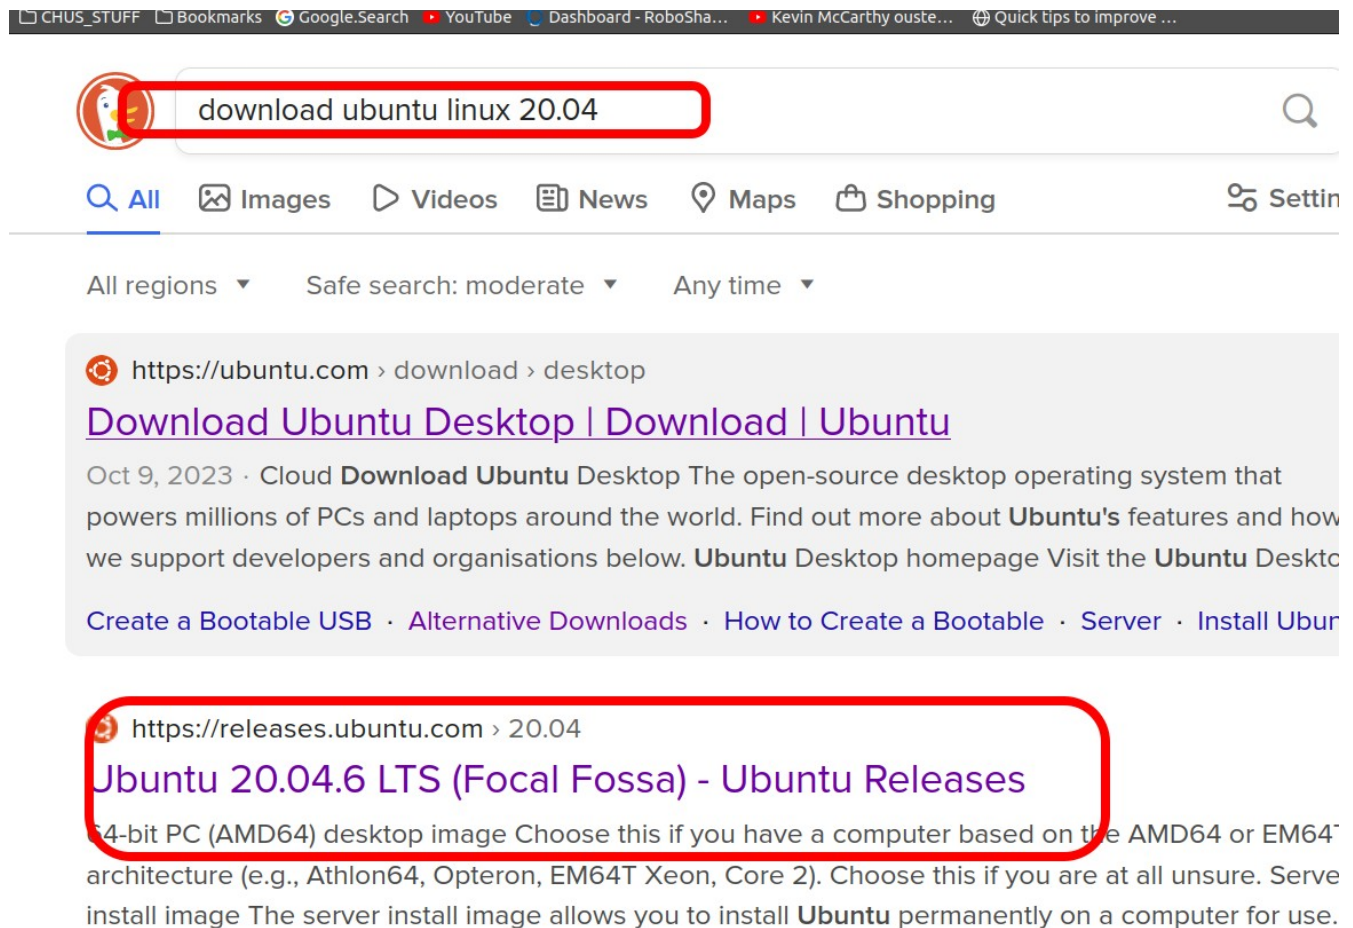

Once Rufus starts, we need to fill in some boxes.

1 – Rufus should have already “seen” the inserted USB stick. If it does not – there is a problem. Try another USB stick.

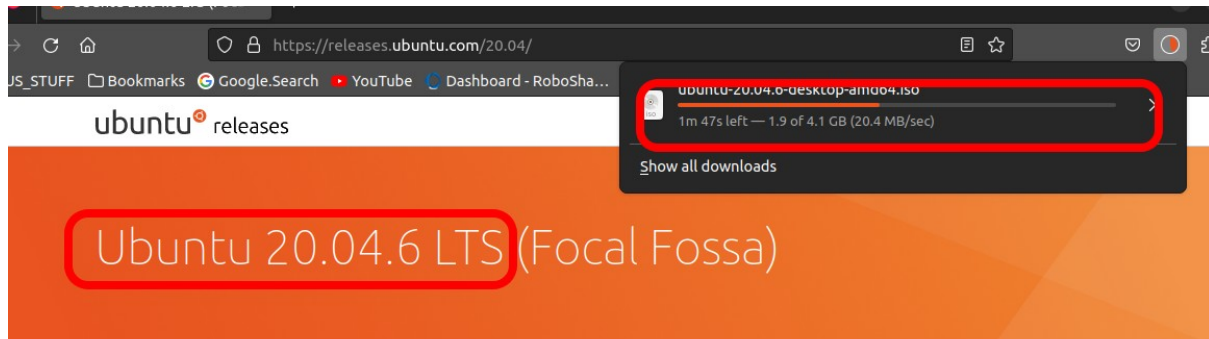

2 – The next thing is to tell Rufus about the Ubuntu Linux we are going to install onto the USB stick.

(I purposely waited until now to go through the steps of obtaining Ubuntu because if you had troubles before this, no point in downloading Ubuntu.)

We are going to pause here with Rufus and go download Ubuntu.

The screenshot shows a Google search interface. The search bar contains the text "download ubuntu linux 20.04", which is highlighted with a red rounded rectangle. Below the search bar, the navigation tabs include "All", "Images", "Videos", "News", "Maps", "Shopping", and "Settings". The search results are filtered by "All regions", "Safe search: moderate", and "Any time". The first search result is from "https://ubuntu.com > download > desktop" and is titled "Download Ubuntu Desktop | Download | Ubuntu". The snippet below the title reads: "Oct 9, 2023 · Cloud **Download Ubuntu** Desktop The open-source desktop operating system that powers millions of PCs and laptops around the world. Find out more about **Ubuntu's** features and how we support developers and organisations below. **Ubuntu** Desktop homepage Visit the **Ubuntu** Desktop". Below the snippet are links: "Create a Bootable USB", "Alternative Downloads", "How to Create a Bootable", "Server", and "Install Ubuntu". The second search result is from "https://releases.ubuntu.com > 20.04" and is titled "Ubuntu 20.04.6 LTS (Focal Fossa) - Ubuntu Releases". The snippet below the title reads: "64-bit PC (AMD64) desktop image Choose this if you have a computer based on the AMD64 or EM64T architecture (e.g., Athlon64, Opteron, EM64T Xeon, Core 2). Choose this if you are at all unsure. Serve install image The server install image allows you to install **Ubuntu** permanently on a computer for use."

Select an image

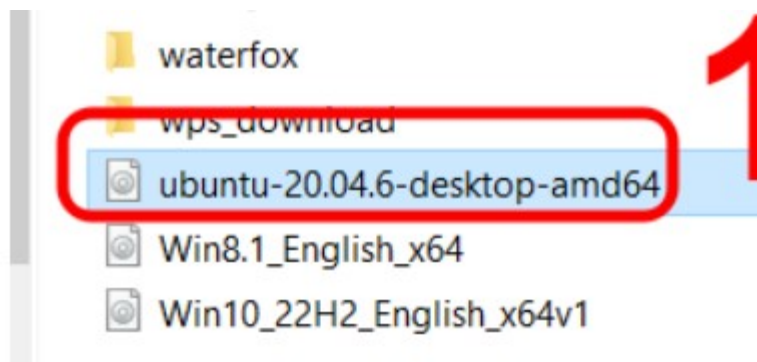

Ubuntu is distributed on three types of images described below.

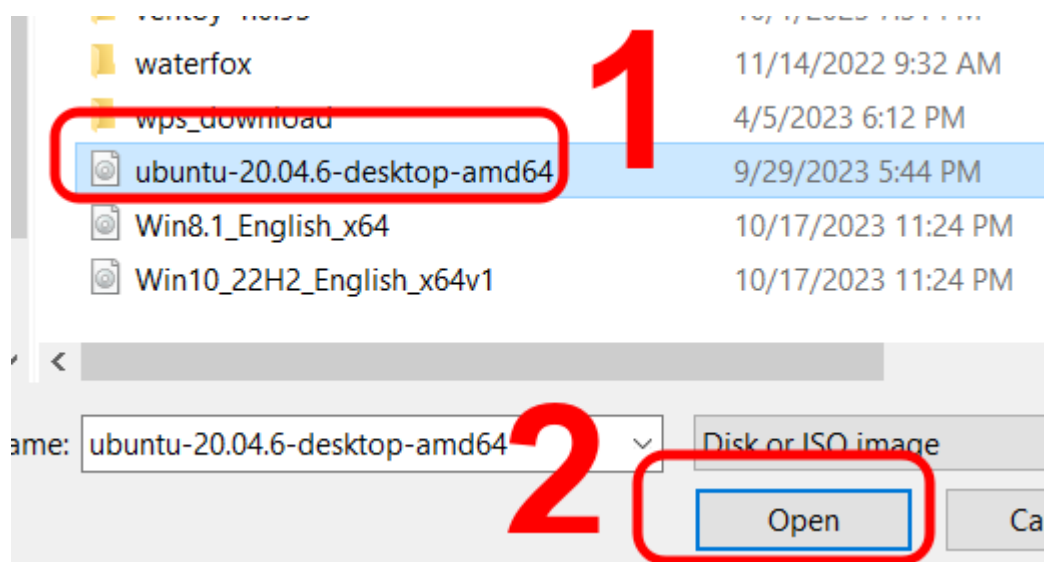

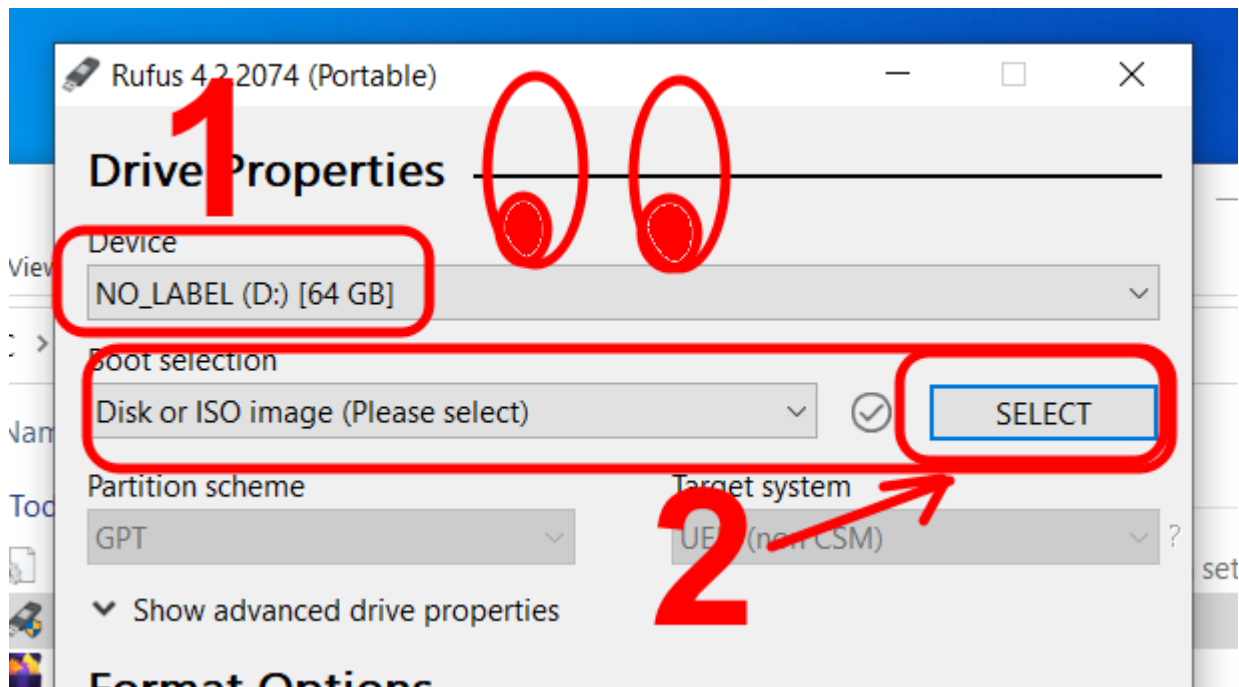

Desktop image

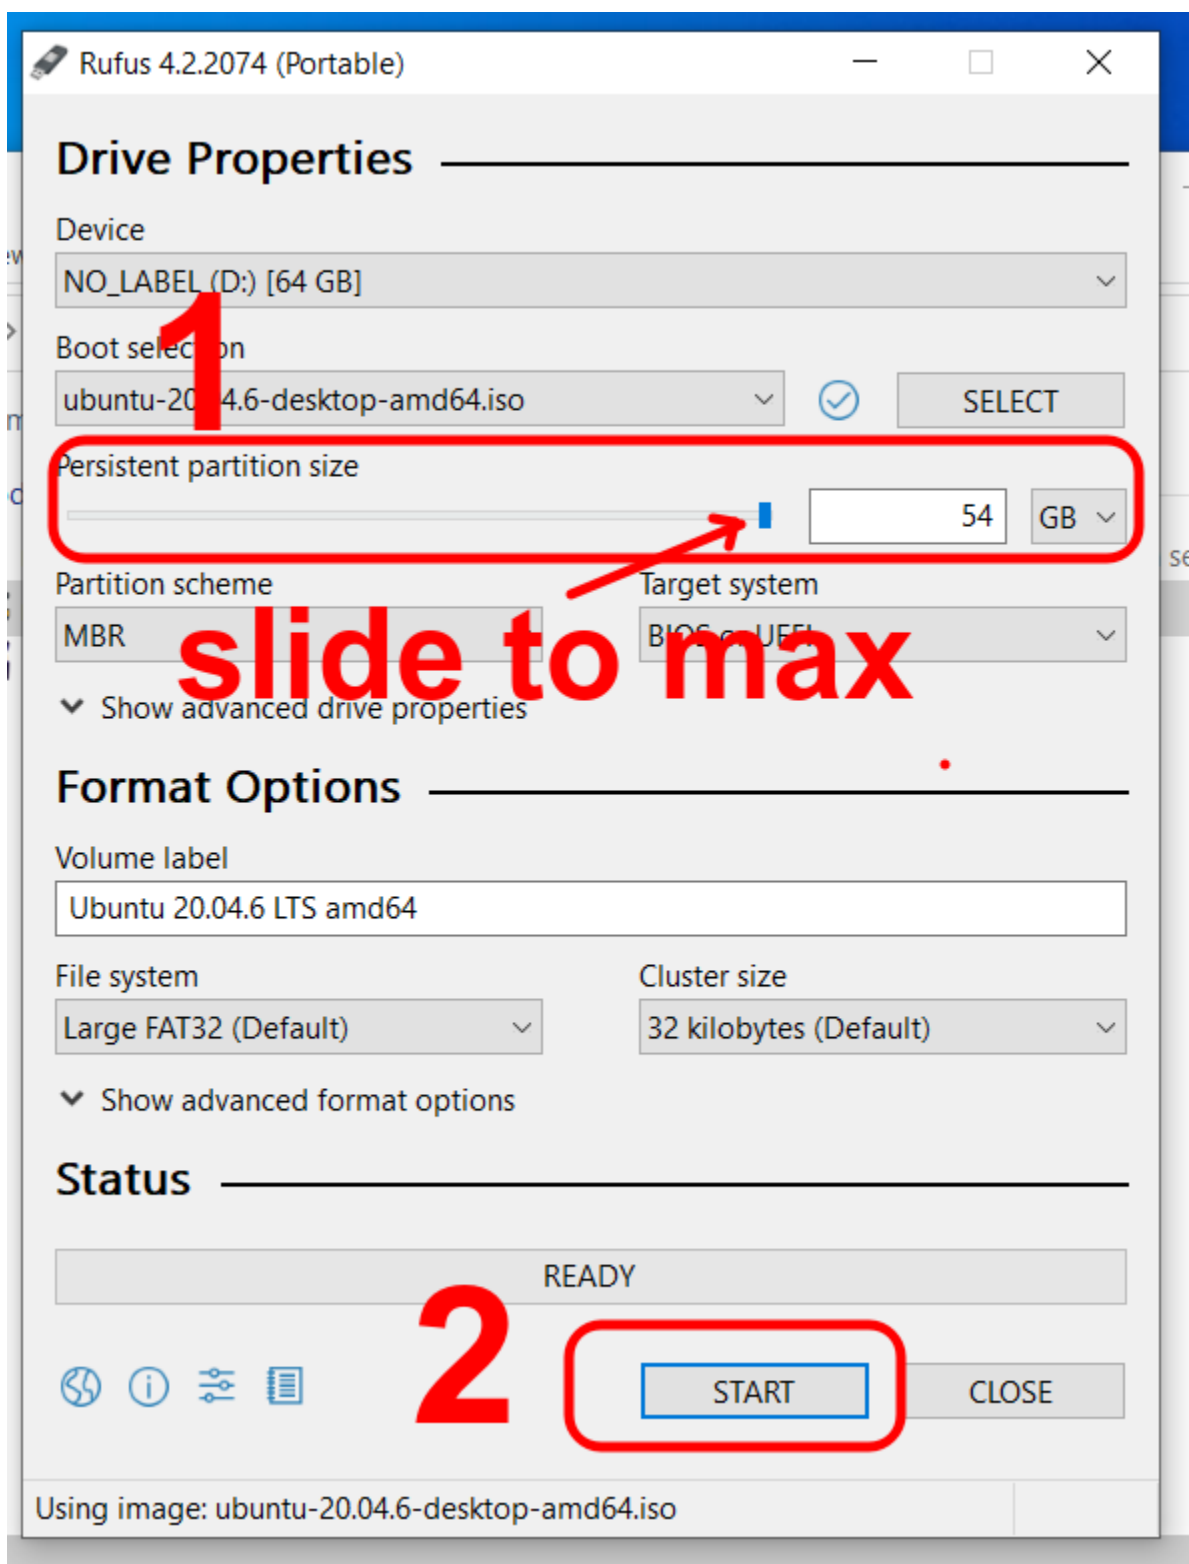

The desktop image allows you to try Ubuntu without changing your computer at all, and at your option to install it permanently later. This type of image is what most people will want to use. You will need at least 1024MiB of RAM to install from this image.

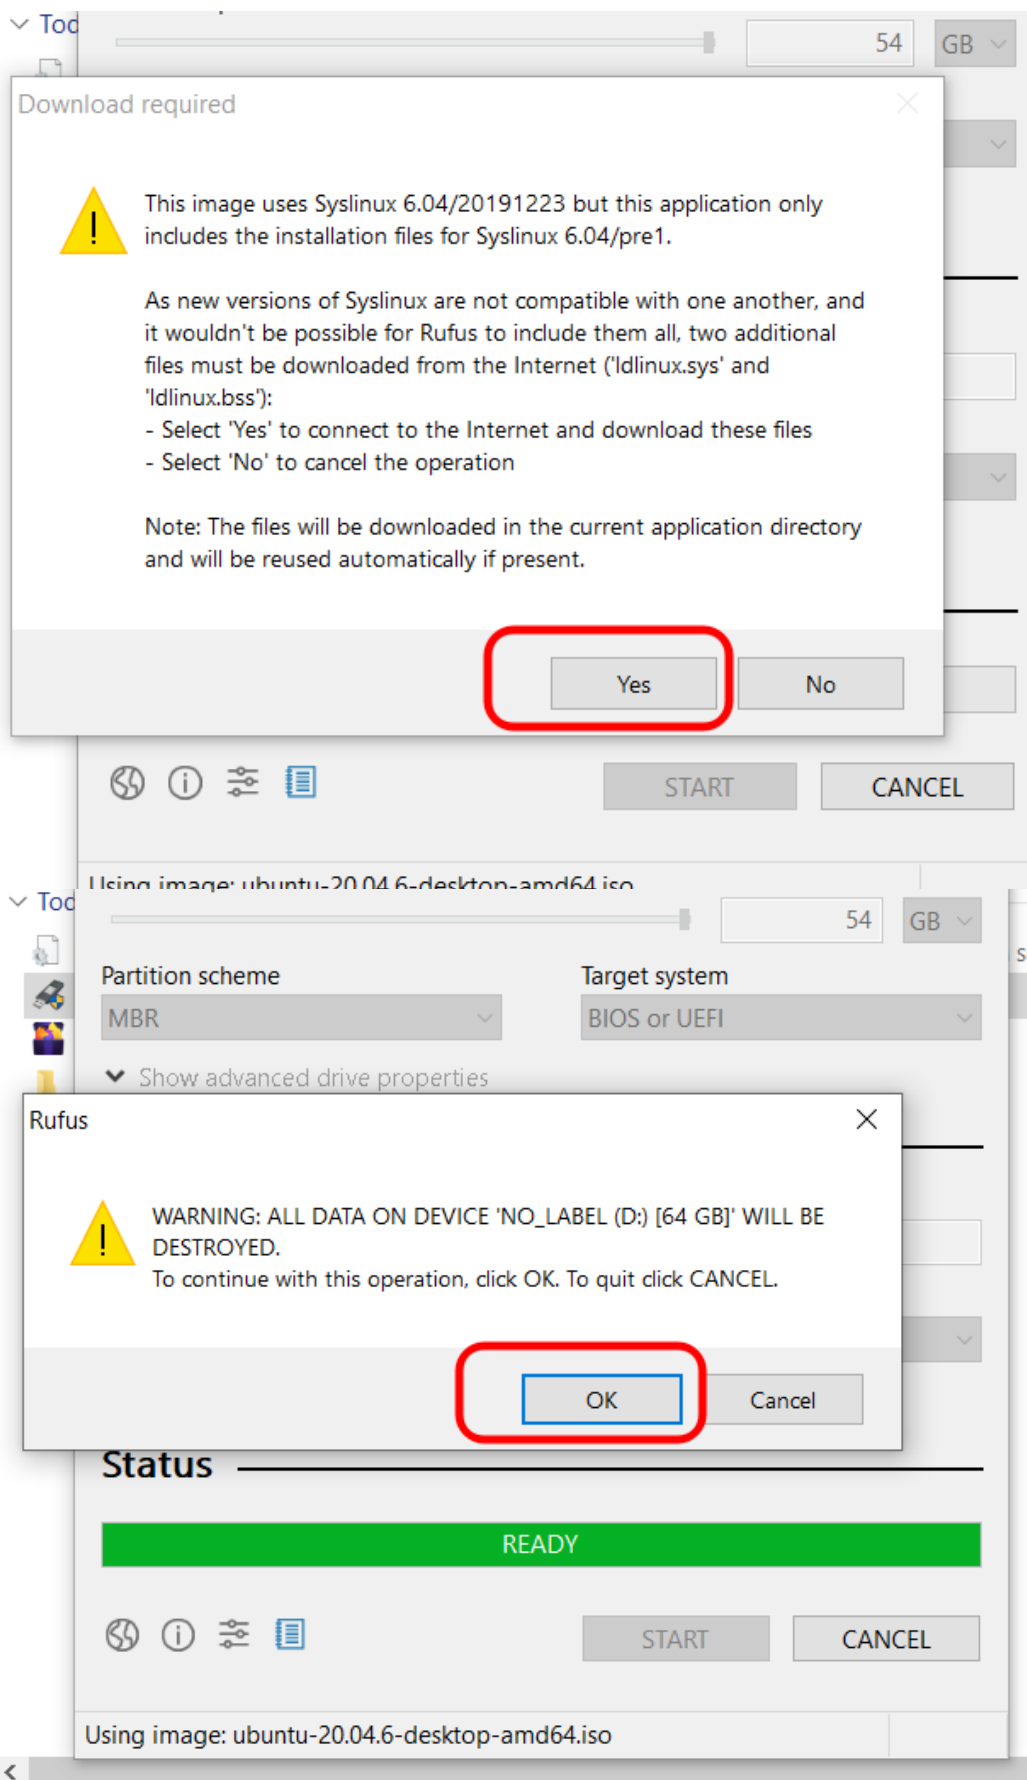

64-bit PC (AMD64) desktop image

Choose this if you have a computer based on the AMD64 or EM64T architecture (e.g., Athlon64, Opteron, EM64T Xeon, Core 2). Choose this if you are at all unsure.
